#### **DETAILED ACTION**

### Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on June 4, 2007 has been entered.

## Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 30, 36, 39, 43, 44, 47 and 49 are rejected under 35 U.S.C. 102(b) as being anticipated by DeBaratolo, Jr. et al. (USPN 5,300,731).

DeBaratolo, Jr. et al. disclose an electrical wiring trunking (Figure 1) comprising a cover (Figure 1, #28) and a base portion (Figure 1, #22), said base portion being constituted by a thermoplastics material section (Column 4, lines 16 – 17) having a U-shaped cross section (Figure 1, #22) and comprising a substantially flat wall having two longitudinal edges and two flanges each extending transversely to said wall and each joined to a respective longitudinal edge of said wall (Column 5, line 64 to Column 6, line 2), wherein said wall contains a longitudinal

Application/Control Number: 09/960,647

Art Unit: 1772

succession of mechanically weakened areas (Figure 1, #94), each mechanically weakened area being a precursor for a hole having a closed periphery (Figure 1, #94; Column 6, line 22 – 42), and each hole precursor is a closed contour formed by a succession of through-openings located along the periphery of the hole or a blind hole whose bottom is constituted by a continuous web. wherein the contour is formed by a succession of blind openings, grooves, along the hole periphery (Figure 1, #94; Column 6, line 22 – 42) as in claims 30, 36, 39, 43, 44, 47 and 49.

### Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 31, 33, 34, 37, 40, 42, 45 and 50 are rejected under 35 U.S.C. 103(a) as being unpatentable over DeBaratolo, Jr. et al. (USPN 5,300,731) in view of Gehrs et al. (USPN 5,444,183).

DeBaratolo, Jr. et al. disclose an electrical wiring trunking (Figure 1) comprising a cover (Figure 1, #28) and a base portion (Figure 1, #22), said base portion being constituted by a thermoplastics material section (Column 4, lines 16 - 17) having a U-shaped cross section (Figure 1, #22) and comprising a substantially flat wall having two longitudinal edges and two flanges each extending transversely to said wall and each joined to a respective longitudinal edge of said wall (Column 5, line 64 to Column 6, line 2), wherein said wall contains a longitudinal

Art Unit: 1772

succession of mechanically weakened areas (Figure 1, #94), each mechanically weakened area being a precursor for a hole having a closed periphery (Figure 1, #94; Column 6, line 22 – 42), and each hole precursor is a closed contour formed by a succession of through-openings located along the periphery of the hole or a blind hole whose bottom is constituted by a continuous web, wherein the contour is formed by a succession of blind openings, grooves, along the hole periphery (Figure 1, #94; Column 6, line 22 – 42). However, DeBaratolo, Jr. et al. fail to disclose each hole precursor having an oblong shape, each hole precursor is a through-hole surrounded by a continuous annular web having a thickness that is less than that of said wall and wherein at least some of said hole precursors are adapted to receive a fixation screw.

Gehrs et al. teach each hole precursor is a through-hole surrounded by a continuous annular web having a thickness that is less than that of said wall (Column 2, lines 43 - 46) in a thermoplastic enclosure (Column 2, lines 34 - 36) for the purpose of being able to selectively remove desired sections from the enclosure (Column 2, lines 57 - 60).

It would have been obvious to one of ordinary skill in the art at the time the applicant's invention was made to have provided the hole precursor is a through-hole surrounded by a continuous annular web having a thickness that is less than that of said wall in DeBaratolo, Jr. et al. in order to be able to selectively removed desired sections from the enclosure as taught by Gehrs et al.

Application/Control Number: 09/960,647

Art Unit: 1772

Page 5

With regard to the limitation of "each hole precursor having an oblong shape", it is well settled that a particular shape of a prior invention carries no patentable weight unless the applicant can demonstrate that the new shape provides significant unforeseen improvements to the invention. In the instant case, the application does not indicate any new, significant attributes of the invention due to its shape that would have been unforeseen or even an unforeseen result to one of ordinary skill in the art. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to change the shape of the hole precursor. One skilled in the art would have been motivated to do so in order to vary the item that could be inserted through the precursor. MPEP 2144.04.

With regard to the limitation of "at least some of said hole precursors are adapted to receive a fixation screw", a recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim.

### Response to Arguments

6. Applicant's arguments with respect to claims 30, 31, 33, 34, 36, 37, 39, 40, 42-45, 47, 49 and 50 have been considered but are moot in view of the new ground(s) of rejection.

Art Unit: 1772

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Patricia L. Nordmeyer whose telephone number is (571) 272-1496. The examiner can normally be reached on Mon.-Thurs. from 10:00-7:30 & alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Rena L. Dye can be reached on (571) 272-3186. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
